

Advanced override feature (v2010 r7.2.25 and above)

This allows you to completely override the 'documents and settings' information returned by windows or you network system.

This is useful if you have a school network that changes laptop pathnames from the windows defaults to your own – in some school network systems they are replaced by empty spaces (this should NEVER happen)!

If you would like to use this advanced feature just create a text file called 'override.txt' and make the first line in this file the pathname of the folder that you would like the program to use to store all information. The user should have full read/write access to this folder. For example:

"C:\ReportComplete"

Move this file (override.txt) into the ReportComplete program folder within your 'Program Files' folder – you may need administrator rights to do this.

The next time you start ReportComplete it will use the folder name you specified in the file for all documents and settings.

You cannot use this feature with U3 smart sticks as there is no need to!

If you have any questions please contact support.
